CATALYTIC ACTIVITY: ATP + UDP-N-ACETYLMURAMOYL + L-ALANINE
ADP + ORTHOPHOSPHATE + UDP-N-ACETYLMURAMOYL-L-ALANINE.

PATHWAY: PEPTIDOGLYCAN BIOSYNTHESIS.

SUBCELLULAR LOCATION: CYTOPLASMIC (PROBABLE).

SIMILARITY: BELONGS TO THE MURCDEF FAMILY.

Mean 49.820; Variance 102.447; scale 0.486

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The remaining single-stranded circles (subtracted library) was purified by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              nucleotides present between the Not I site and the oligo-dT track which allows identification of the library
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /map="MMU16C3-C4 region; MMU16C3-C4 region"

bacterial (especially S. aureus) infections. They are also useful against Helicobacter pylori infections and related cancers, ulcers and gastritis. The antibacterial agents are useful to treat in-dwelling devices for infection prevention or generally as wound treatments to prevent adhesion of bacteria to matrix proteins. The MurC polypeptide is also useful for diagnosing or prognosing a (susceptibility to) disease, for raising antibodies; to identify modulators or specific receptors; in rational	the recombinant production of the polypeptide. Agonists of the Murc polypeptide are used to treat conditions requiring increased activity or expression of the polypeptide. Antagonists, inhibitory nucleic acid or competitive polypeptide are useful for inhibiting the polypeptide e.g.	Claim 1; Page 5; 39pp; English. The invention relates to a UDP-N-acetylmuramate:L-alanine ligase (MurC polypeptide) encoded by the S. aureus MurC gene. Host cells containing an expression system comprising the MurC gene can be used for	N-PSDB; V80065.  N-PSDB; V80065. Host cells CC (Murc polypeptide) encoded by the S. aureus Murc gene can be used for the recombinant production of the polypeptide. Agonists or the Murc CC (CC polypeptide are used to treat conditions requiring increased activity or CC expression of the polypeptide. Antagonists, inhibitory nucleic acid or CC competitive polypeptide are useful for inhibiting the polypeptide e.g. CC bacterial (especially S. aureus) infections. They are also useful against CC The antibacterial agents are useful to treat in-dwelling devices for infection prevention or generally as wound treatments to prevent adhesion of bacteria to matrix proteins. The Murc polypeptide is also useful for diagnosing or prognosing a (susceptibility to) disease, for raising contained the polypeptide is also useful for antibodies; to identify modulators or specific receptors; in rational

The proteins are used in the treatment of disease, for inducing an immune response by administering them, to produce antibody and/or T-cell immune response. Antagonists of the proteins are used for the inhibition of bacterial polypeptides. Conditions which may be treated include bacterial infections, especially respiratory, cardiac, gastrointestinal, central nervous, eye, kidney, urinary tract, skin, bones and joints. The proteins can also be used to identify antimicrobial compounds which are broad spectrum antibiotics, especially useful in the treatment of H. pylori infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ward
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         24-SEP-1997; 307485.

Vaccines are administered, e.g. by injection, orally or through the skin, typically at 0.01-1000 (especially 10-300) mu g/ml per dose.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Streptococcus pneumoniae, for treatment or prevention of infection e.g. pneumonia, otitis media or meningitis. Probes based on the nucleic acid are used to detect Streptococcus infection (by usual hybridisation or amplification methods), also for isolating Streptococcus genes or their allelic variants. The protein can be used similarly to detect specific antibodies in standard immunoassays, especially for diagnosing or monitoring infections. Antibodies which bind the protein are used to

Claim 2; Columns 21-22; 13pp; English.
The present sequence represents Streptococcus pneumoniae MurD protein
(uridine-diphosphate-N-acetylmuramy1-r-lany1-p-isoglutamate ligase).
The MurD protein is useful in a method for identifying compounds
that inhibit Streptococcus pneumoniae MurD activity. Compounds
that inhibit screptococcus pneumoniae MurD activity. Compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 uridine-diphosphate-N-acetylmuramyl-L-alanyl-D-isoglutamate ligase, useful for identifying antibacterial compounds Claim 1; Column 13-16; 14pp; English.
This is the amino acid sequence of the Streptococcus pneumoniae murb biosynthesis protein. The murb gene encodes the enzyme uridine-diphosphate-N-acetylmuramyl-L-alanyl-D-isoglutamate ligase. The nucleic acid can be used for the production of recombinant Murb protein and the implementation of large scale screens to identify new antibacterial compounds targeted at the stem peptide biosynthetic pathway involved in the synthesis of the bacterial cell wall. Structural analysis of the Murb protein will enable structure-based drug design to develop novel compounds for the treatment of antibiotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (ELIL ) LILLY & CO ELI.
